Radio Engineering Exam

Florian Kaltenberger

24.6.2016

1. Consider the ITU-R Pedestrian A channel model given by the following power delay profile

Excess tap delay [ns]	**Relative power [dB]**
0	0
110	-9.7
190	-19.2
410	-22.8

   (a) Calculate the total power, the average delay, and the RMS delay spread of the given PDP. 1Pt

   (b) What is the approximate coherence bandwidth of this channel? 1Pt

   (c) Would a system with a 10MHz bandwidth be considered wideband or narrowband when operating in this kind of channel? 1Pt

2. The small scale fading is assumed to follow a Rayleigh fading distribution. Compute the available fading margin for an outage probability of 10% for one and for two antennas (using RSSI selection diversity). 2Pts

3. Consider a LTE system at $f_c = 2100$ MHz and a maximum user speed of $v_{\max} = 300$ km/h. Assume that the channel has a classical Doppler spectrum.

   (a) What is the Doppler bandwidth and the approximate coherence time? 1Pt

   (b) Can the receiver safely assume that the channel is constant during a transmission time interval of 1ms? 1Pt

4. Assume that a system needs a $C/I = 0$dB to work at an acceptable quality. Further assume that the path loss decays with a path loss exponent $\eta = 4$ and the system requires a fading margin of $M = 10$dB.

   (a) Compute the relative reuse distance D/R and the minimum cluster size N. 1Pt

(b) Assume an Erlang-B system with a blocking probability of 10%. Assume further that a total of 30 channels are available. What is the offered traffic in Erlang per cell (use the table in the appendix)? 1Pt

(c) The city of Nice has a population density of 5000 people per km^2. Assuming that every person generates a traffic of 2 milli-Erlang, what is the required cell radius (assume that each cell covers a surface of $A = r^2\pi$)? 1Pt

5. (a) What is a geometry based stochastic channel model? Give an example. 2Pts

(b) Describe the Kronecker MIMO model (model category, formula + description, pros + cons). 2Pts

(c) What models exist to model diffraction over multiple edges? 1Pt

(d) What are the requirements for a channel to be identifiable by means of channel sounding? 1Pt

(e) What makes it possible for LTE networks to employ a cluster size of $N = 1$? 1Pt

(f) Some other LTE parameters still need careful planning in a multi-cell environment. Which ones? 1Pt

(g) What is the difference between mechanical and electrical tilt of an antenna? 1Pt

(h) 5G system will very likely make use of frequencies above 20GHz (mm-wave). What are the main challenges in this frequency band? 1Pt

Total: 20Pts

Have fun!

Erlang B Traffic Table

Maximum Offered Load Versus B and N
B is in %
